Both diodes must light up **GREEN**.

Troubleshooting

If only one LED or no LED is lit, check the following points:

- Does the socket have voltage?
- Is the adapter firmly plugged into the device?
- Are the ferrites connected hand-tight?
- Is the ferrite ring closed?

If there is an “electrical circuit”, there is a metallic connection in front of and behind the device. behind the device. The voltage breaks down (short circuit).

Find a suitable place in front of or behind the possible circuit and reinstall the appliance. again. Follow the enclosed installation instructions.

Attention!

Always close the ferrite ring before connecting the appliance to the mains!
The induction field covers the entire inside of the ferrite ring; the ferrites do not have to be in firm contact with the cable.
